

This project proposes an architecture that de-centres the human subject and instead privileges a non-human user. Conceived as a productive centre and primary dwelling for alpacas, the design derives its sitting, orientation, and material articulation from the animals' physiological and behavioural needs. Located on Monte Cimone, the highest peak of the Apennines, the altitude provides climatic conditions suited to alpaca breeding. Striking in its insertion within the mountain territory, the building asserts a clear yet measured presence through its restrained, function-driven form. Its transparent programme is organised into four volumes: alpaca shelter, farmer's dwelling, utility storage, and wool processing facility, establishing spatial parallels between human and non-human habitation.
